Concept in the data	Term	Full IRI	Why this term
Individual artist	schema:Person	http://schema.org/Person	Widely used, directly understood by search engines and Wikidata tooling
School or collective	foaf:Group	http://xmlns.com/foaf/0.1/Group	schema.org has no general "group of people"; schema:Organization would wrongly imply a formal body for "British School 18th century"
Name as recorded by Tate	schema:name	http://schema.org/name	Keeps Tate's "Surname, Forenames" form unchanged
Tate artist ID	schema:identifier	http://schema.org/identifier	Links each resource back to its source record
Tate web page	schema:url	http://schema.org/url	Value is an IRI, so it is resolvable
Gender	schema:gender + schema:Male / schema:Female	http://schema.org/gender	Gives enumerated IRIs instead of free text
Birth / death year	schema:birthDate / schema:deathDate, typed xsd:gYear	http://schema.org/birthDate	Year-only precision matches the source; gYear makes it comparable
Place of birth / death	schema:birthPlace / schema:deathPlace → Wikidata IRI	http://schema.org/birthPlace	Links to an external authority (I3)
City located in country	schema:containedInPlace	http://schema.org/containedInPlace	Lets queries go from city to country. We state it in the data so it can be queried on its own and records the country Tate gave.
Same artist in Wikidata	owl:sameAs	http://www.w3.org/2002/07/owl#sameAs	Standard identity link between datasets
Alive in October 2014	ont:livingAtSnapshot (own term)	https://w3id.org/FAIR-course-UT/2025-2026/group3/ont#livingAtSnapshot	No existing term expresses "alive at the time of a data snapshot"

- uncertain dates reduced to the year in yearOfBirth
- groups get no person properties
- unreconciled places are left out rather than added as text
